CDNA Library Preparation: M.B. Soares Lab Clone distribution: Researchers may obtain BMAP CDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BMAP CDNAs whose availability will be considered under appropriate and limited collaborative arrangements The tissue for this library was contributed by Dr. Xin-Yuan Fu, yale University School of Medicine The following repetitive elements were found in this CDNA sequence: 1-62,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BE900861 645 bp mRNA linear EST 29-SEP-2000 601673832F1 NIH_MGC_21 Homo sapiens cDNA clone IMAGE:3956958 5',

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and 6-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present cDNA sequence encodes human partial cardiac adenylcyclase VI (ACVI) isoform which is used for generating a third beta-ASP transgene, used in the exemplification 540 CCGCGCAGCCCCTCTGCGGGCCTCTGGTGCCCTGTGTTTTGTATACATCGCATACACG 120 180 CTCCTCCCCATCCGCATGCGGGCTGCCGTCCTCAGCGGCCTGGGGCCTCTCCACCTTGCAT 180 240 240 300 300 360 420 420 480 480 540 900 900 lynucleotide encoding a modified adenylylcyclase polypeptide or enhancing cardiac function in mammalian hearts, and for heart disease, especially congestive heart failure -Gaps 9 9 GTTAACGTGGTGCTGGCCATCCTGGCGGCAGTGCAGGTCGGGGGGGCGCTTTCGCAGCAGCA CTCCTCCCCATCCGCATGCGGGCTGCCGTCCTCAGCGGCCTGGGCCTCTCCACCTTGCAT TTGATCTTGGCCTGGCAACTTAACCGTGGTGATGCCTTCCTCTGGAAGCAGCTCGGTGCC AATGTGCTGCTGTTCCTCTGCACCAACGTCATTAGCATCTGCACACACTATCCAGCAGAG GTGTCTCAGCGCCAGGCCTTTCAGGAGCCCGCAGTTACATCCAGGCCCGGCTCCACCTG CAGCATGAGAATCGGCAGCAGGAGCGGCTGCTGTCGGTATTGCCCCAGCACGTTGCC CAGCATGAGAATCGGCAGCAGCAGCGGCTGCTGCTGTCGGTATTGCCCCCAGCACGTTGCC **ATGGAGATGAAAGACATCAACACAAAAAAAAAAGAAGACATGTTCCACAAGATCTACATA** CAGAAGCATGACAATGTCAGCATCCTGTTTGCAGACATTGAGGGCTTCACCAGCCTGGCA TCCCAGTGCACTGCGCAGGAGCTGGTCATGACCCTGAATGAGCTCTTTGCCCGGTTTGAC 1812; ö compositions for Length 301 301 361 361 421 421 481 541 541

The present invention describes a recombinant replication-defective viral particle (I) comprising a gene encoding a beta-adrenergic signalling protein (beta-ASP) operably linked to a promoter. Also described are: (1) a recombinant pro-viral plasmid (Ia) comprising a gene encoding a beta-ASP, as above, operably linked to a promoter and further comprising a replication-defective viral genome: (2) a (mammalian) cell transfected with (I) or (Ia); (3) an isolated polynucleotide comprising a sequence encoding a human adenylylcyclase isoform VI (AC-VI), or a variant having AC activity; (4) a human AC-VI encoded by (3); (5) an isolated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; adenylylcyclase VI; AC-VI; beta-adrenergic signalling protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         transgene; gene therapy; congestive heart failure; cardiac function; adenovirus; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         signalling

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylytoclases (also referred as adenylytoclases, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present DNA sequence encodes human cardiac adenyloclases VI (ACVI) isoform which is used for generating a third beta-ASP transgene, used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  815

Novel polynucleotide encoding a modified adenylylcyclase polypeptide useful for enhancing cardiac function in mammalian hearts, and for treating heart disease, especially congestive heart failure -
```

Page 134-140; 153pp; English Claim 6;

The present invention relates to methods and compositions for enhancin cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylytcyclases (also referred as adenylcyclases adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present DNA sequence encodes human cardiac adenylcyclase VI (ACVI) isoform which is used for generating a four the teach and the exemplification the invention

The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the mycoardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adennylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetaes) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present cDNA sequence encodes human modified cardiac adenylcyclase VI (KCVI) isoform which is used for generating a beta-ASP transgene, used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                422
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          479

A canine heart cDNA library was constructed in lambda gt10 and was screened with a 970 bp AatI-HincII fragment from type I adenylyl cyclase cDNA probe (enrodes the first cytoplasmic domain of adenylyl cyclase, which has significant homology to other previously known types of adenylyl cyclase). One positive clone, of 5.4 kb was obtd. Positive colonies were subcloned into pUC18 and further subcloned and sequenced bidirectionally. The 5.4 kb clone was used to rescreen the library and on averlapping clone contg. the 5' end of the gene was isolated. Together the two clones cover the complete canine cardiac adenylyl cyclase gene. The gene is suspected of being involved in the regulation of cardiac function and it is thought that decreased activity of adenylyl cyclase in the heart may be a major factor in the development of heart failure. Thus the adenylyl
                                                                                                                                                                                                                1739

                                                                                                                                                                                                                                                                                                                                                A recombinant Adenylyl cyclase is described which lacks membrane bound domains. Separation and purification of the recombinant enzyme is much easier compared with wild type enzymes and the recombinant enzyme is more stable than the wild type enzyme which allows easier screening of compounds that stimulate and inhibit Adenylyl cyclase activity. The recombinant adenylyl cyclase comprises a chimera of adenylyl cyclase comprises a chimera may be linked by a linker peptide. The recombinant adenylyl cyclase is useful for screening inhibitors and stimulators of adenylyl cyclase activity. Inhibitors of the enzyme are useful for treating cholera, pitultary tumors, heart failure, ischaemia, endocrine disorders and cell necrosis. Stimulators of adenylyl cyclase are useful for treating pseudohypoparathyroidism and other

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (1) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (1). The method
                                                                                                                                                                                              2366

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ACATGATCGAAGCCATCTCGCTGGTGCGTGAGGTAACAGGTGTGAACGTGAACATGCGTG 1506
           ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to ABB5734) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      364
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           424

This sequence encodes the human type V adenylyl cyclase (hAC5) of the invention. hAC5 has a similar putative structure to other adenylyl cyclase isoforms but, like type VI, is distinguishable in that it has a caracter as a similar type VI, is distinguishable in that it has a larger N-terminus and a relatively shorter C-terminus as it lacks the correction. The hAC5 polypeptides are useful in assays that screen for potential therapeutic agents, which modulate hAC5 activity. These collopeptides are also useful in assays for the diagnosis of diseases and disorders. Agonists of hAC5 are useful control agents in such assays, and they may have useful effects in vivo for treating disease. Antibodies acting as (ant)agonists have diagnostic and therapeutic effects, and are useful in immunoassays for hAC5. (Ant)agonists are particularly useful in treating diseases caused by abnormal hAC5 activity (e.g. In the heart and brain), and in diseases, which are alleviated by modulating hAC5 activity. The oligonuclectides are useful in methods that inhibit or regulate hAC5 enables the development of tissue-specific and selective and society apparagonists have in treating particular human diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4;

                                                                                                                                                                                                                                                                                                                                                                                                                                                   Left ventricular tissue of canine heart was used as a source of mRNA. A cDNA library was prepd. in lambda gt10 phage. A 970 bp Aat-HincII fragment from type I adenyly1 cyclase cDNA was used as probe. The clones isolated were used to obtain CDNA encoding CACV. This probe may also be used to screen a human cardiac cDNA library to obtain the cDNA encoding human CACV. CACV, its analogues and antibodies are useful in thraspy or diagnostic assays, e.g. in modifying and determining cardiac function. A decrease in CACV content of the heart contributes to impaired cAMP prodn. and in heart failure. The CACV can also be used to screen for cpds. which stimulate or inhibit

Separation and purification of the recombinant enzyme is much easier compared with wild type enzymes and the recombinant enzyme is more stable than the wild type enzyme which

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            allows easier screening of compounds that stimulate and inhibit Adenylyl cyclase activity. The recombinant adenylyl cyclase comprises a chimera of adenylyl cyclase (21 and (22 domains linked covalently. The domains may be linked by a linker peptide. The recombinant adenylyl cyclase is useful for screening inhibitors and stimulators of adenylyl cyclase activity. Inhibitors of the enzyme are useful for treating cholera, pitultary tumors, heart failure, ischaemia, endocrine disorders and cell necrosis. Stimulators of adenylyl cyclase are useful for treating pseudohypoparathyroidism and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              99
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         601

The invention relates to human adenylyl and guanylyl cyclases (ADGUC)
preferably ADGUC1-ADGUC5 and nucleic acid molecules encoding such
polypeptides. ADGUC sequences are useful in the diagnosis, prevention
colypeptides. ADGUC sequences are useful in the diagnosis, prevention
and treatment of cardiovascular disorders (e.g. anglina pectoris,
myocardial infarction, ischemic heart disease, hypertension and
atherosclerosis), vision disorders (e.g. keratoconjuctivitis sicae,
keratitis, iritis, cataract), neurological disorders (e.g. epilepsy,
Alzheimer's disease, Pick's disease, Huntington's disease, dementia,
Parkinson's disease, Dick's disease, Huntington's disease, dementia,
Parkinson's disease, Creutzfeldt-Jakob disease, stroke, schizophrenia,
mental disorders including mood and anxiety and prion diseases including
kuru), reproductive disorders (e.g. infertility, endometriosis,
impotence, uterine fibroid and gynaecomastia), smooth muscle disorders
(e.g. arrhythmias, asthma and migraine) and bacterial infections
contransgenic animals to model human diseases. They are useful in
somatic or germline gene therapy, ADGUC polynucleotides are also useful
contransgenic animals to model human diseases. They are useful in
somatic or germline gene therapy, ADGUC polynucleotides are also useful
translocation, inversion, etc. among normal, carrier or affected
individuals, ADGUC polypeptides are useful in a number of drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel human adenylyl and guanylyl cyclases and polynucleotides encoding
the cyclases, useful for treating, diagnosing or preventing
cardiovascular, neurological, vision, reproduction and smooth muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                techniques and in vaccines. The present sequence is human ADGUC-2 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 3137;

detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention
